

Cooling Water Treatment Chemicals

A successful cooling water treatment must address initial conditioning, scale, fouling and corrosion control. Thermax cooling water treatments can be applied to virtually any cooling system with any type of makeup water. Proper application of water chemistry for a given system, our cooling water treatments provide clean heat transfer surfaces that are free of corrosion and scale, and operate at top efficiency. Formulations for control of scale and corrosion for a variety of makeup water chemistries are available on request. Control of scale and corrosion requires a balanced approach based on a careful appraisal of water quality and operating conditions.
